

Manufacturing Validation Report

Model: miles_morales_shoes

Validation Findings

Severity	Category	Message
Low	Segmentation	Input asset was monolithic and lacked semantic segmentation metadata.

Validation Scope

- Rules evaluate global measurements, material metadata, and component extraction confidence.
- Findings are decision-support signals, not final production approvals.
- Factory teams should verify flagged dimensions and material callouts against physical samples.

Method & Assumptions

- GLB units are treated as meters and sanity-checked against footwear dimensions.
- Geometry is normalized so X=length, Y=height, and Z=width before measurement.
- Component extraction is heuristic; monolithic meshes are reported conservatively.
- Measurements and renders use an exported normalized intermediate GLB.
- Scale normalization applied; original length estimate 1988.28 mm, target 280.0 mm.
